Amines Chapter In Organic Chemistry

- Nomenclature • Primary amines are named in systematic (IUPAC) nomenclature by replacing the -e of the corresponding parent alkane with -amine.
- In common nomenclature they are named as alkylamines
- Simple secondary and tertiary amines are named in common nomenclature by designating the organic groups separately in front of the word amine.

Extraction is often employed in organic chemistry to purify compounds. Liquid-liquid extractions take advantage of the difference in solubility of a substance in two immiscible liquids (e.g. ether and water). The two immiscible liquids used in an extraction process are (1) the solvent in which the solids are dissolved, and (2) the extracting solvent.

Aldehydes and ketones can be converted into 1^o, 2^o and 3^o amines using reductive amination. The reaction takes place in two parts. The first step is the nucleophilic addition of the carbonyl group to form an imine. The second step is the reduction of the imine to an amine using a reducing agent.

Aliphatic amines, which are amines connected to an alkyl chain, display solubility in organic polar solvents. Aromatic amines, which are amines that participate in a conjugated ring, donate their lone pair of electrons into the benzene ring, and thus their ability to engage in hydrogen bonding decreases.
