Can you tell me the basic difference between AISC 9 th edition and AISC 360 codes ? Which one should I use ? The most significant difference between AISC 9 th edition and AISC 360-05/AISC 360-10 specification is that the former follows a stress based approach whereas the later follows a strength based approach. The former calculates allowable member stresses and the later calculates allowable ...

The question is that "If I design a structure by AISC ASD 9th edition and use default $C_b = 1$, is it overdesign?" In case of latest AISC code, C_b is calculated as following, $C_b = 12.5 \max / (2.5 M_{max} + 3M_a + 4M_b + 3M_c)$ and in case of $m_a = m_b = m_c = \max$, $C_b = 1$. On the other hand, in AISC ASD code (9th edition ASD) C_b is calculated as following

The most sweeping change in the 2005 Specification is that it incorporates both Load and Resistance Factor Design (LRFD) and what is now termed Allowable Strength Design (ASD). By incorporating both design philosophies, the 2005 Specification replaces both the 9th Edition ASD and the 3rd Edition LRFD.

Channels - The AISC 9th Edition (ASD) specification does not specifically address the allowable stress for weak axis bending of channels. Therefore, the program uses the most similar formula for

the weak axis bending of wide flanges ($0.75 \cdot F_y$). For a complete and thorough treatment of channel code checks, refer to the LRFD specification. ...
