Arrangement Of Electrons In Atoms

4.1.1 Arrangement of electrons in atoms. In the following table the electrons in an atom are shown arranged in shells and sub-shells. The charge of the nucleus is $+Ze$ (Z = atomic number), and it is surrounded by Z electrons (charge $-e$) in a neutral atom. Shells. The electrons with the same principal quantum number n are said to form a shell.

Chapter 4: Arrangement of Electrons in Atoms. The stability of an electron configuration depends upon whether a principle energy level is completely full. Stability also depends upon whether a subshell within that principal energy level is full. Furthermore, relative stability can be achieved even when a sublevel is exactly half full.

If both electrons in the same orbital had the same spin state, each electron would have the same four quantum numbers. If one electron has the opposite spin state, the fourth quantum number is different and the exclusion principle is obeyed. 2. This orbital notation is possible if the helium atom is in an excited state.

CHAPTER 4 Arrangement of Electrons in Atoms

Both electrons fit into the $1s$ subshell because s subshells can hold up to 2 electrons; therefore, the electron configuration for helium atoms is $1s^2$ (spoken as "one-ess-two"). The $1s$ subshell cannot hold 3 electrons (because an s subshell can hold a maximum of 2 electrons), so the electron configuration for a lithium atom cannot be $1s^3$.
