Surface anatomy (also called superficial anatomy and visual anatomy) is the study of the external features of the body of an animal. In birds this is termed topography. Surface anatomy deals with anatomical features that can be studied by sight, without dissection. As such, it is a branch of gross anatomy, along with endoscopic and radiological anatomy. ...

The crossed extensor reflex is a withdrawal reflex.. When the reflex occurs the flexors in the withdrawing limb contract and the extensors relax, while in the other limb, the opposite occurs.. An example of this is when a person steps on a nail, the leg that is stepping on the nail pulls away, while the other leg takes the weight of the whole body.

What is Diffusion? Diffusion is the result of high-speed random motion of gas or liquid molecules. For example, if the number of molecules present in area A is greater than in area B, mathematical probability dictates that more molecules will move from A to B than from B to A. This net movement of molecules from high to low concentrations is called diffusion.

Prior mouse genetic research has set the stage for a deep understanding of appetite regulation. This goal is now being realized through the use of recent technological advances, such as the ability to map connectivity between neurons, manipulate neural activity in real time, and measure neural activity during behavior.

Retrograde tracing from liver parenchyma close to the hilus (i.e., where all nerve bundles enter the liver) only results in a limited amount of DRG labeling from Th7–11, indicating that only very few DRG afferents innervate the hepatoportal system .. As just mentioned, the classic anterograde and retrograde tracers are only able to reveal the location of first order sensory and motor neurons.
