Generally, a Server is a high-end network computer managing connected devices ("clients") and their access to multiple applications as a central resource, whereas a Database is a repository that supports an application's back-end data processing. Databases were initially "flat files ...

#### Difference between a Server and Database

In computing, a file system or filesystem controls how data is stored and retrieved. Without a file system, information placed in a storage medium would be one large body of data with no way to tell where one piece of information stops and the next begins.

The primary key and the unique key both are unique keys in a relational database that guarantee the uniqueness of the values on a column or a set of columns. There is already a pre-defined unique key constraint within a primary key constraint. While a primary key is particularly used to identify ...

A clustered file system is a file system which is shared by being simultaneously mounted on multiple servers. There are several approaches to clustering, most of which do not employ a clustered file system (only direct attached storage for each node). Clustered file systems can provide features like location-independent addressing and redundancy which improve reliability or reduce the ...

There are three broad concurrency control techniques, i.e. Multi-version Concurrency Control (MVCC), Strict Two-Phase Locking (S2PL), and Optimistic Concurrency Control (OCC), and each technique has many variations. In MVCC, each write operation creates a new version of a data item while retaining the old version.

As described in the official document, PostgreSQL supports a very large number of features required by the SQL standard of 2011. Query processing is the most complicated subsystem in PostgreSQL, and it efficiently processes the supported SQL. This chapter outlines this query processing; in particular, it focuses on query optimization.
